

- Indicate which parts of the code you rewrote

We revised the `connect()` method, and then in all methods we revised the SQL syntax and made more descriptive comments for input parameters.

- Briefly describe why you chose to rewrite the code (examples: it was not working, it was not thoroughly tested, it needed refactoring, etc)

We had to rewrite the code because it did not run, mainly because of our `connect()` method. We also had some issues with SQL syntax. We also chose to rewrite some comments that were not descriptive enough.

- Briefly describe the changes you made, and how these improved the code.

We did some casting of non-string input parameters to the string data type so that we could concatenate them with the SQL query input. We also fixed our `connect()` method and passed the returned result of connection as an input parameter to all the other methods so that we could connect to the database for all relevant methods. Finally, we updated the comments for all the methods' input parameters to contain data type and SQL column from which they're being extracted (e.g., for `getBestActressPicGenre()`: original comment for input parameter was "actressFilm," and we changed it to "String actressFilm, obtained from actressFilm column of SQL table").
